

Intrauterine local anaesthetic after hysteroscopy to reduce post operative pain - A Randomised controlled trial

ACTRN12615001214527

Status	RECRUITING
Phase	Phase 4
Sponsor	Kassam Mahomed
Enrollment	450 participants

Plain Language Summary

This study is testing whether injecting a local anesthetic (numbing medicine) into the uterus at the end of a hysteroscopy procedure reduces pain and speeds up recovery. A hysteroscopy is a procedure where a small camera is inserted through the cervix to look inside the uterus. Pain after the procedure is common, and this simple step may help.

You may be eligible if:

- You are a woman between 18 and 70 years old
- You are scheduled for a hysteroscopy for diagnosis, Mirena (IUD) insertion, or polyp removal

You may NOT be eligible if:

- You have chronic ongoing pain conditions
- You have a known allergy to local anesthetic medications

Talk to your doctor about whether this trial might be right for you.

Key Eligibility Criteria

Inclusion (1)

- These will be women being booked for hysteroscopy for diagnosis, insertion of Mirena and or removal of a polyp

Exclusion (2)

- Women with chronic pain
- Known allergy to local anaesthetic

Locations (1 total)

Ipswich Hospice Care - Ipswich, QLD, Australia
