

MOZambique snApshot of emeRging Trends (MOZART) Disease Surveillance Study

ACTRN12616001250426

Status	RECRUITING
Sponsor	Mary MacKillop Institute for Health Research Centre for Research Excellence, Australian Catholic University
Enrollment	7,000 participants

Plain Language Summary

This study — called the MOZART study — is building a snapshot of what diseases people are actually being treated for at hospitals in Mozambique, looking at both infectious diseases (like malaria) and non-infectious diseases (like diabetes and heart disease). The goal is to understand how the disease landscape is changing as life expectancy improves in this part of the world.

You may be eligible if:

- You present to the emergency department of one of the four participating hospitals in Mozambique during the study period
- You are able to respond to questions from the study team, or have a family member who can

You may NOT be eligible if:

- You are unconscious, severely confused, or under the influence of drugs and no family member is available to provide information

Talk to your doctor about whether this trial might be right for you.

Key Eligibility Criteria

Inclusion (1)

- During each study period (initially four sets of 30-day snap=shot periods followed by a repeat snap-shot in the opposite season), all patients (i.e. 24 hours a day) presenting to the emergency department of the participating hospitals will be recorded and cases randomly selected for more detailed clinical profiling. All selected patients, regardless of age, will be included in the screening process.

Exclusion (1)

- Patients will be excluded from the study if they are unable to respond to the trained nurses or the study survey team (i.e., unconscious, confused due to mental illness, severely ill, or under the influence of illicit drugs) unless the study team is able to obtain data from a family member/partner.

Locations (3 total)

Maputo City, Mozambique
Nampula, Mozambique
Sofala, Mozambique
