

# Comparison of neuromuscular monitorings (TOF-Watch SX versus Philips NMT Module) in patients undergoing rhinoplasty or rhinoseptoplasty.

ACTRN12617000625370

---

Status	RECRUITING
Sponsor	CHU UCL Namur - Mont-Godinne
Enrollment	30 participants

## Plain Language Summary

---

Certain surgeries require muscles to be completely relaxed using drugs called muscle relaxants. Monitoring how relaxed the muscles are is important for patient safety, especially when waking someone up from anaesthesia. This study compares two different devices that measure muscle relaxation to see if they give the same results — because if they don't agree, it could affect patient safety.

You may be eligible if:

- You are between 18 and 80 years old
- You are classified as low surgical risk (ASA I or II)
- You are scheduled for rhinoplasty (nose reshaping) or septoplasty (nose surgery) under general anaesthesia

You may NOT be eligible if:

- You are pregnant or breastfeeding
- You have kidney or liver failure
- You have a neurological condition
- You have a known allergy to anaesthetic drugs
- You are taking medicines that affect muscle relaxation

Talk to your doctor about whether this trial might be right for you.

## Key Eligibility Criteria

---

### Inclusion (3)

- aged 18 to 80,
- classified ASA I or II,
- undergoing rhinoplasty or rhinoseptoplasty under general anaesthetic

### Exclusion (4)

- pregnant and breastfeeding women,
- patients with renal or hepatic insufficiency,
- patients with neurological deficit,
- patients with a suspected allergy to the drugs used in the protocol or receiving treatment which will interfere with neuromuscular transmission

## Locations (1 total)
