

Familial Mediterranean Fever and Related Disorders: Genetics and Disease Characteristics

NCT00001373

| | |
|-------------------|--|
| Status | RECRUITING |
| Sponsor | National Human Genome Research Institute (NHGRI) |
| Enrollment | 5,000 participants |

Key Eligibility Criteria

Inclusion (17)

- There are three populations that will be included in this study: subjects with known or suspected autoinflammatory diseases, family members of subjects with known or suspected autoinflammatory diseases, and healthy controls. Persons interested in participation may be given a screening questionnaire to determine eligibility. Questions in the screening questionnaire are important to help us determine if subjects have known autoinflammatory diseases, or if there is a high clinical suspicion of autoinflammatory disease.
 - In order to be eligible to participate in this study as a subject with known or suspected autoinflammatory disease, an individual must meet all of the following criteria:
 - Stated willingness to participate in study procedures (which at the very least includes providing a mail-in sample for genetic analysis);
 - Regardless of gender, at least one month of age;
 - A medical history that, in the expert opinion of the study team, is consistent with the possibility of autoinflammatory disease; and
- ... and 12 more (see full listing online)

Exclusion (1)

- For any of the three categories of subjects, an individual will be excluded from participation in this study if he or she has a medical condition that would, in the opinion of the investigators, confuse the interpretation of the study.
