

Radial Artery Occlusion and Dual Artery Hemostasis After Transradial Approach.

NCT04933136

Status RECRUITING
Sponsor Laval University
Enrollment 500 participants

Key Eligibility Criteria

Inclusion (1)

- Any patient referred for diagnostic or interventional catheterization through radial or cubital approach

Exclusion (4)

- Unable to understand the study design and sign an informed consent
- Unable to receive antiplatelet therapy with aspirin and/or clopidogrel-prasugrel and/or ticagrelor and intravenous anticoagulant treatment with heparin or bivalirudin
- Presence of any local conditions like hematoma or pseudo-aneurysms precluding radial or cubital access.
- Presence of PPG while simultaneously compressing the radial and cubital arteries (due to collateral branches or interosseous artery), which prevents the establishment of non-occlusive hemostasis with the Terry2(TM) band.
