

# Supraclavicular Bupivacaine Vs. Supraclavicular Liposomal Bupivacaine for Orthopedic Wrist Surgery

NCT06179004

---

Status	RECRUITING
Phase	Phase 3
Sponsor	University of North Carolina, Chapel Hill
Enrollment	100 participants

## Key Eligibility Criteria

---

### Inclusion (2)

- Age greater than or equal to 18
- Scheduled for orthopedic wrist surgery at University of North Carolina at Chapel Hill.

### Exclusion (5)

- Contraindications to regional anesthesia
- Emergent surgery Open fractures will be treated emergently and will not allow adequate lead time for enrollment in this study. Also, open fractures are usually accompanied by other traumatic injuries that would confound the pain related outcomes in this study.
- Significant peripheral neuropathy or neurological disorder affecting the upper extremity
- Pregnancy Pregnant women have physiologic changes that make them more sensitive to local anesthetics. That would introduce a confounding element in interpreting the effectiveness of the peripheral nerve blocks being studied.
- Cognitive or psychiatric condition that might affect patient assessment and/or inability to provide informed consent.
