

Bougie Versus Endotracheal Tube Alone on First-attempt Intubation Success in Prehospital Emergency Intubation (BETA Trial)

NCT06307392

Status	RECRUITING
Phase	Not Applicable
Sponsor	Nantes University Hospital
Enrollment	710 participants

Key Eligibility Criteria

Inclusion (2)

- Managed by a physician staffed mobile intensive care unit (MICU).
- With an indication of emergency prehospital endotracheal intubation.

Exclusion (4)

- Pregnant women
- Patients with a "not to be resuscitated" indication.
- Patients with predictors of difficult intubation (that can be collected in the prehospital setting, including previous history of face, neck, throat surgery or pathology, limited mandibular protrusion, cervical spine trauma, facial trauma, ear-nose-throat malignancy, head or neck burns, history of previous difficult airways) for whom the use of a bougie is indicated on first intubation attempt.
- Patients under guardianship, trusteeship or safeguard of justice and patients with no health insurance.
