

# Early Intravenous to Oral Antibiotic Switch in Uncomplicated Staphylococcus Aureus Bacteraemia

NCT06336824

---

Status	RECRUITING
Phase	Phase 3
Sponsor	Clinical Research Centre, Malaysia
Enrollment	290 participants

## Key Eligibility Criteria

---

### Inclusion (7)

- Blood culture positive for Staphylococcus aureus (S. aureus).
- Received 3 to 7 days of definitive IV antimicrobial therapy, defined as:
  - Cloxacillin or cefazolin for methicillin-sensitive staphylococcus aureus (MSSA); Vancomycin or ceftaroline for methicillin-resistant staphylococcus aureus (MRSA).
  - Proven in-vitro susceptibility and adequate dosing given (as determined by the principal investigator).
- Achieved clearance of bacteraemia, defined as at least one documented latest negative follow-up blood culture obtained within 72 hours after the initiation of definitive IV antimicrobial therapy.

... and 2 more (see full listing online)

### Exclusion (25)

- Evidence of metastatic infection of S. aureus: for example, infective endocarditis, intraabdominal abscess, lung empyema, and osteomyelitis. Radiological investigations such as chest X-ray, ultrasound, echocardiogram, and CT scan are not mandatory prior to enrolment, but should be done at the discretion of the treating physician if clinically indicated.
- Septic shock, defined as hypotension requiring vasopressors to maintain MAP  $\geq$ 65 mmHg despite adequate volume resuscitation.
- Received more than 5 days of non-study antibiotics as empirical therapy prior to enrolment.
- Polymicrobial bloodstream infection, defined as isolation of pathogens other than S. aureus from a blood culture obtained prior to randomization. Common skin contaminants such as coagulase-negative staphylococci, Bacillus spp., and diphtheroid will not be considered to represent polymicrobial infection.
- Known history of S. aureus infection within the past 3 months.

... and 20 more (see full listing online)
