

# Understanding the Transition from Normal Melanocytes to Nevus to Melanoma

NCT06605417

---

**Status** RECRUITING  
**Sponsor** Fundacion Clinic per a la Recerca Biomédica  
**Enrollment** 100 participants

## Plain Language Summary

---

This study examines how normal skin pigment cells (melanocytes) change over time into moles (nevi) and potentially into melanoma, a type of skin cancer. Researchers are studying large congenital nevi — birthmarks present from birth — to better understand the biological process of this transformation.

**\*\*You may be eligible if...\*\***

- You are 18 years or older
- You have a large congenital nevus (birthmark) estimated to be approximately 20 cm in size
- Biological material (tissue samples) is available for study
- You are willing to sign an informed consent form

**\*\*You may NOT be eligible if...\*\***

- No biological material is available for testing
- You have not signed informed consent

Talk to your doctor to see if this trial is right for you.

## Key Eligibility Criteria

---

### Inclusion (2)

- Congenital nevus with estimated size of 20 cm
- Be over 18 years of age

### Exclusion (2)

- No available biological material
- Not having signed the informed consent

## Locations (2 total)

---

Hospital Clínic de Barcelona (Dermatology service), Barcelona, Spain  
French National Institute of Health and Medical Research, Marseille, France
