

Effect of Extracellular Calcium on Carbetocin Mediated Contractility in Human Myometrium

NCT06930391

Status	RECRUITING
Phase	Not Applicable
Sponsor	Samuel Lunenfeld Research Institute, Mount Sinai Hospital
Enrollment	40 participants

Key Eligibility Criteria

Inclusion (2)

- non-laboring women with gestational age between 37 to 41 weeks
- not exposed to exogenous oxytocin, scheduled for a primary or first repeat cesarean delivery under neuraxial anesthesia.

Exclusion (6)

- patients requiring general anesthesia
 - more than 1 previous cesarean delivery
 - history of uterine atony
 - emergency cesarean section in labor
 - patients using medications that could affect myometrial contractility such as nifedipine, labetalol, or magnesium sulphate.
- ... and 1 more (see full listing online)
