

Hemodynamic Effects of Intravenous Paracetamol in Patients Undergoing Emergency Laparotomy

NCT07466108

| | |
|------------|------------------|
| Status | RECRUITING |
| Phase | Not Applicable |
| Sponsor | Cairo University |
| Enrollment | 90 participants |

Key Eligibility Criteria

Inclusion (1)

- Adult patients, ASA I-III undergoing emergency laparotomy

Exclusion (5)

- Severe cardiac morbidities (impaired contractility with ejection fraction \leq 40%, heart block, arrhythmias, tight valvular lesions)
- Hemodynamically unstable patients (defined as patients with MAP \leq 65 mmHg or need vasopressor to maintain MAP \geq 65 mmHg).
- Patients with high shock index (heart rate / systolic blood pressure \geq 1)
- Pregnant or lactating women,
- Allergy of any of the study drugs
